

ITSecure+™

The Power of ITSecure – and more

For clients with more stringent security requirements like HIPAA or PCI, we now offer ITSecure+. ITSecure+ combines everything available in our ITSecure offering with seven additional features for enhanced protection and peace of mind. Roll the features out as a package for comprehensive coverage for a cost-effective flat fee.

ITSecure+ includes the following features:

OpenDNS Content Filtering

All ITS SharedVision clients are protected from unwanted Internet intrusions by OpenDNS. The ITSecure+ content filtering feature provides added controls with flexible, location-aware policies and an unlimited number of custom block or allow lists. Alert your users with customizable block pages and allow designated users to safely bypass certain blocks.

E-mail Encryption and ClickProtect

Integrated with the ITS anti-spam protection included in all SharedVision plans, our e-mail encryption offering protects valuable information easily and economically, and complies with privacy regulations. ClickProtect shows an unmasked web address so that users can be confident that they're going to the actual pages shown in the e-mail. Previews of the pages can also be enabled for an extra layer of protection.

Two-Factor Authentication for Remote Desktop Services and Virtual Private Networks (optional for an added fee)

Protect network security made vulnerable by remote user access with our Two-Factor Authentication service. Similar to accessing your bank account via an ATM, 2FA requires users to create a PIN known only to them. The service generates one-time passwords that get combined with the PIN to allow safe logons every time – providing simple and effective secure remote access.

Mobile Device Management

Take complete control of company e-mail on any mobile device with our simplified, efficient tool. Our solution allows us to control a variety of devices – including Android, Apple iOS, BlackBerry, and Windows.

Phishing Training and Routine Testing

With 91% of successful data breaches started with a phishing attack, can you really afford not to train your users on how to avoid one? Our tools help you know which of your users are most vulnerable to clicking on malicious mail and train them to better avoid social engineering, spear phishing, and ransom ware attacks.

ENHANCED Workstation Encryption

We provide full encryption technology on all workstations, including Macs. Controlling it all from one console, it's hard drive encryption without compromise.

Hard Drive Destruction Service

Outdated servers and workstations are easy to get rid of, but what happens to the hard drives and the valuable data you had on them when they go? Don't take chances – allow ITS to have the drives properly wiped of data and then physically destroyed so you can be certain the drives and their contents will never be accessed by anyone else.
